Deployment Issues

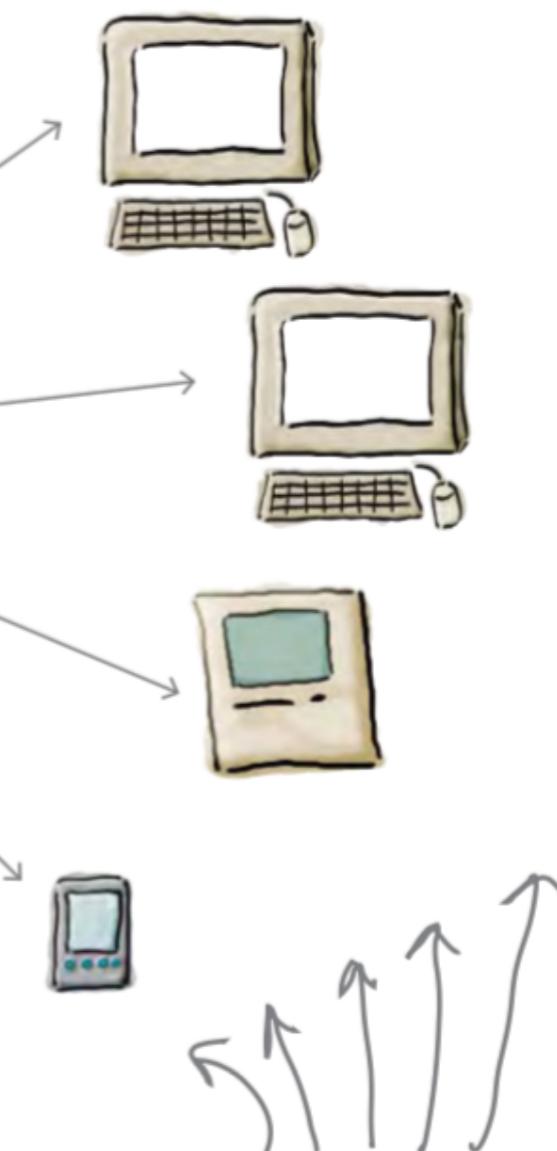

- Clients & Servers
- Hosting Providers
- Domain Names
- Transferring the Sites Files
- HTTP
- Absolute & Relative Paths

To make web pages, you create files written in the HyperText Markup Language (HTML for short) and place them on a web server (we'll talk about how to get your files on a server later in the book).

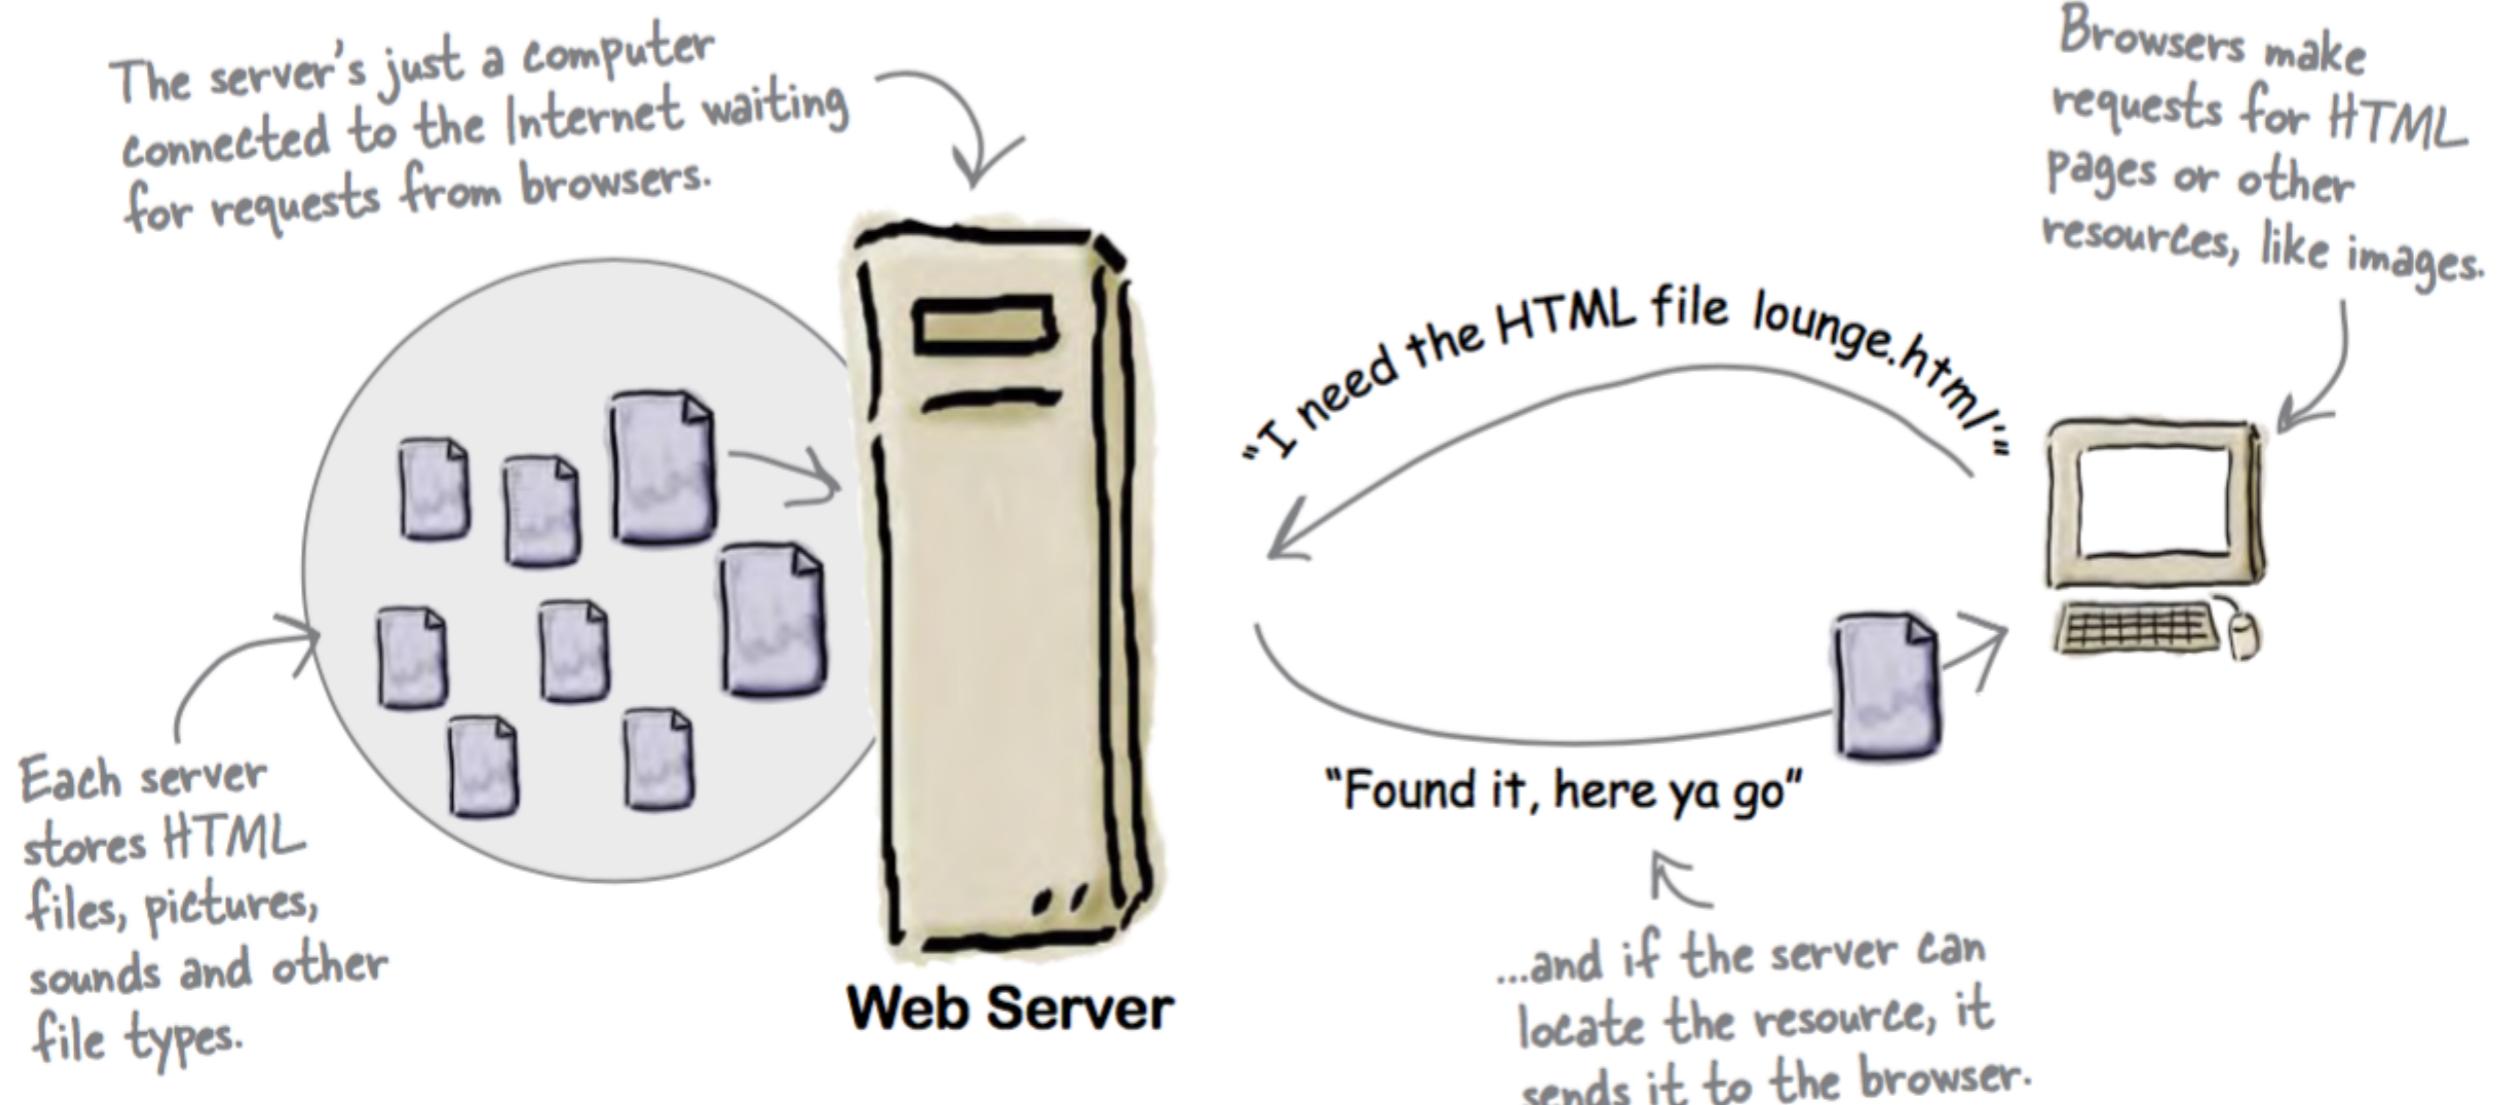

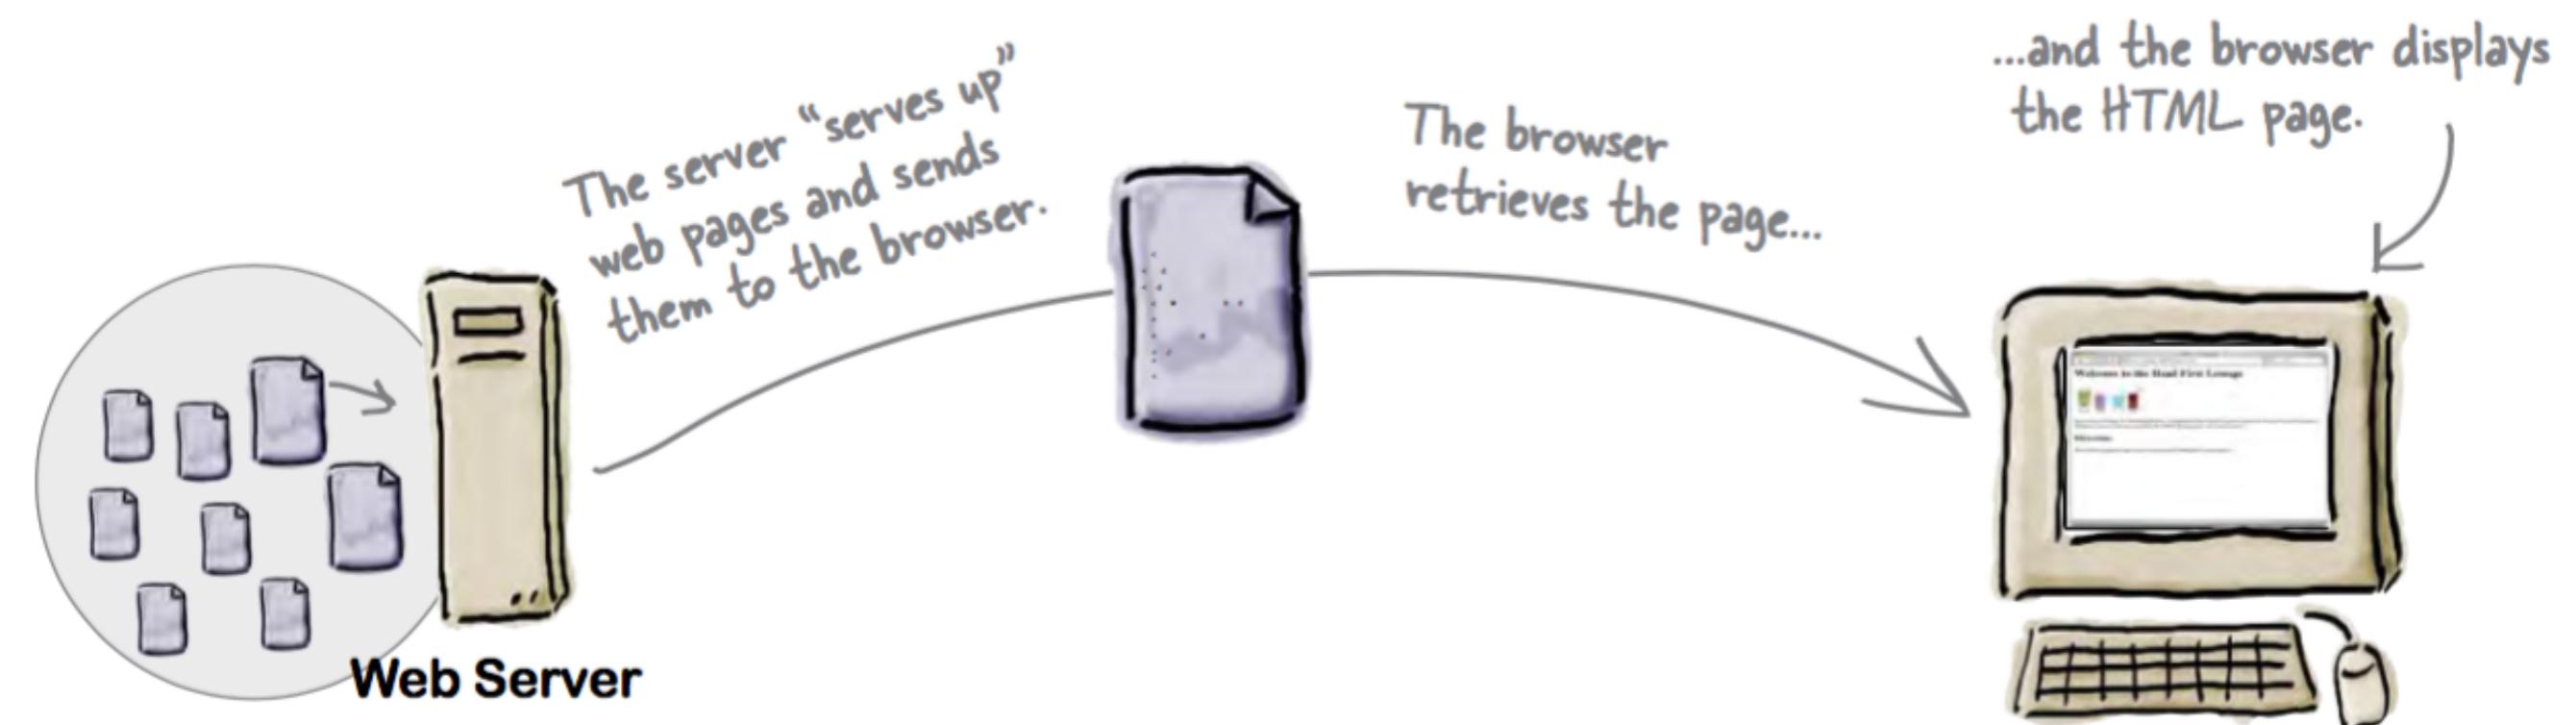

The HTML in your web page tells the browser what it needs to know to display your page. And, if you've done your job well, your pages will even display well on cell phones and mobile devices, and work with speech browsers and screen magnifiers for the visually impaired.

Once you've put your files on a web server, any browser can retrieve your web pages over the Internet.

And there are a lot of PCs and devices connected to the Internet all running web browsers. More importantly, there are friends, family, fans, and potential customers using those devices!

Hosting Company

- To get your pages on the Web, you need a server that actually lives on the Web full-time.
- Find a hosting company and let them worry about the details of keeping a server running.

Hosting Company Checklist

- **Technical support:** Does the hosting company have a good system for handling your technical questions?
- **Data transfer:** This is a measure of the amount of pages and data the hosting company will let you send to your visitors during a given month
- **Backups:** Does the hosting company regularly make a backup of your pages and data that can be recovered in the event that the server has a hardware failure?
- **Domain names:** Does the hosting company include a domain name in its pricing
- **Reliability:** Most hosting companies report keeping websites up 99% of the time or better.
- **Add-ons:** Does your package include other goodies such as email addresses, forums, or support for scripting languages

Domain Names

This part is the domain name.

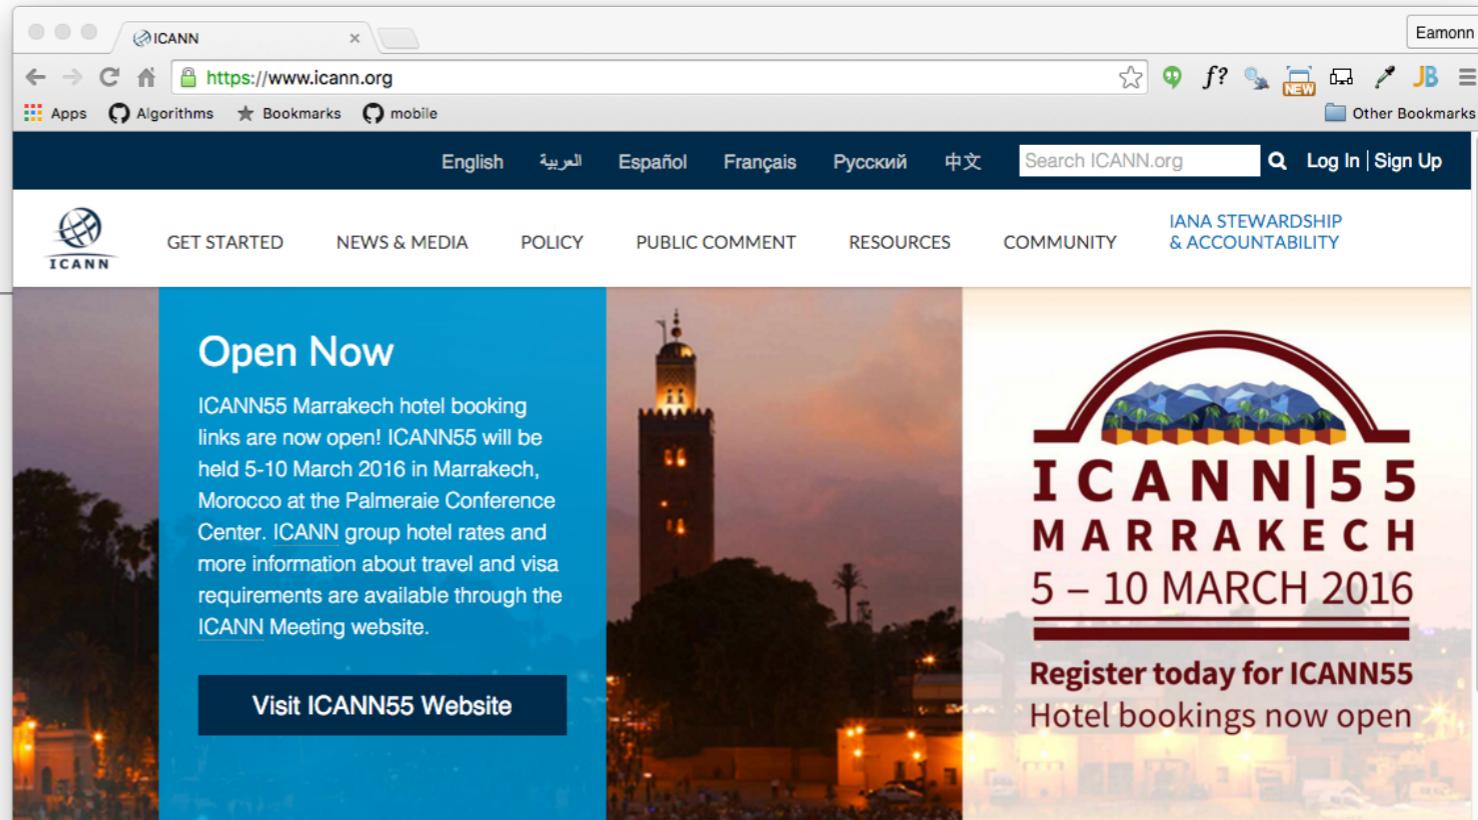

www . starbuzzcoffee . com

This part is the name of a specific server **IN** the domain.

There are different domain "endings" for different purposes: .com, .org, .gov, .edu; and also for different countries: .co.uk, .co.jp, and so on. When choosing a domain, pick the one that best fits you.

ICANN

- Domain names are controlled by a centralized authority (ICANN) to make sure that only one person at a time uses a domain name.
- Hosting Companies will often throw in your domain name registration with one of their package deals.
- Register of domain name registration companies:
 - <https://www.internic.net/regist.html>

News and Announcements

[Experts Wanted for New gTLD Program Review](#)

ICANN is seeking experts in consumer protections, economics & security to help examine the affects of new gTLDs on the domain name industry. Members of this pioneering group will represent the broader community & their analysis will impact future rounds of the New gTLD Program. Applications are due 13 November 2015.

The Accredited Registrar Directory

The following companies have been accredited by ICANN to act as registrars in one or more TLDs:

[Alphabetical Listing by Company/Organization Name](#)
[Listing by Location of Registrar](#)
[Listing by Language Supported](#)

Since new accredited registrars are establishing registration services on an ongoing basis, this directory will be updated frequently. It is suggested that you refer to this directory often for new, up-to-date information.

For information on the ICANN registrar accreditation process, please refer to the [ICANN Accredited Registrar Information Page](#).

Use your domain with your favorite service.

Website builders, portfolio tools, personal homepages... quickly connect your domain and start building.

Your computer, where the Starbuzz pages currently live

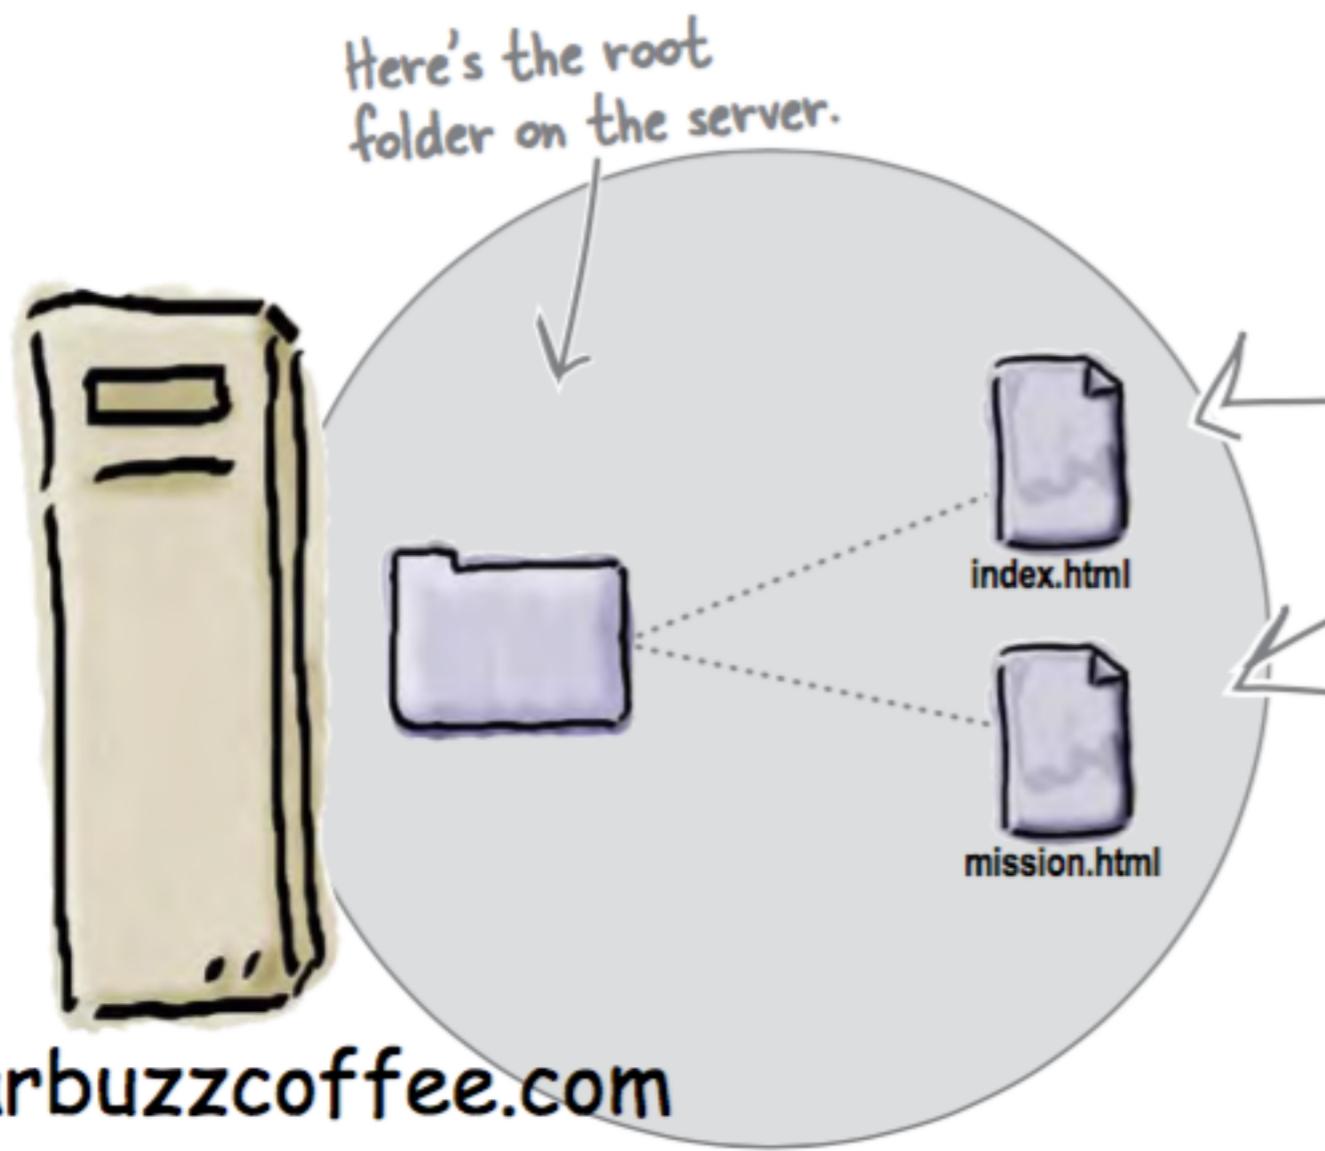

Here's the new website name. We're using the `starbuzzcoffee.com` domain (since we beat you to it, you'll have to use your own domain name instead).

Remember your Starbuzz pages? There are two: the main page (`index.html`) and the page that contains the mission statement (`mission.html`).

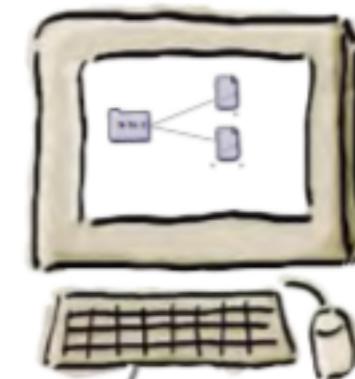

Here's the new web server. The hosting company has already created a root folder for you, which is where all your pages are going to go.

The files are sitting on your computer.

You need to transfer them to the server, and then they'll be "live" on the Web.

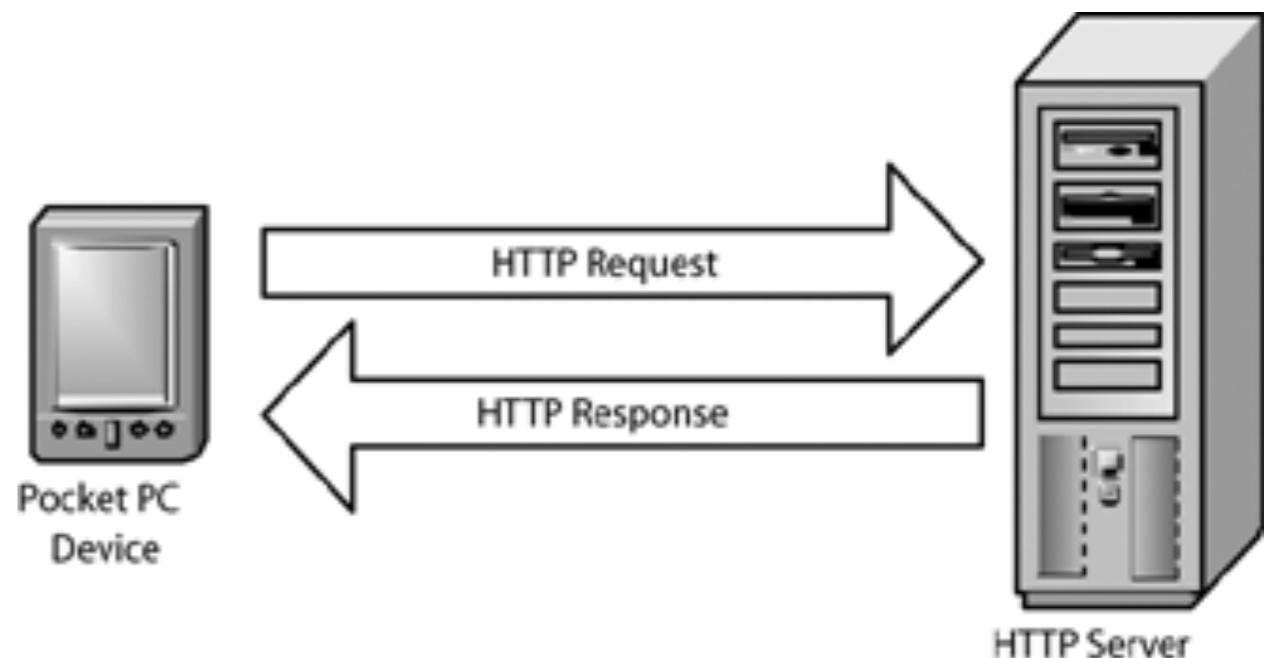

Transferring Files

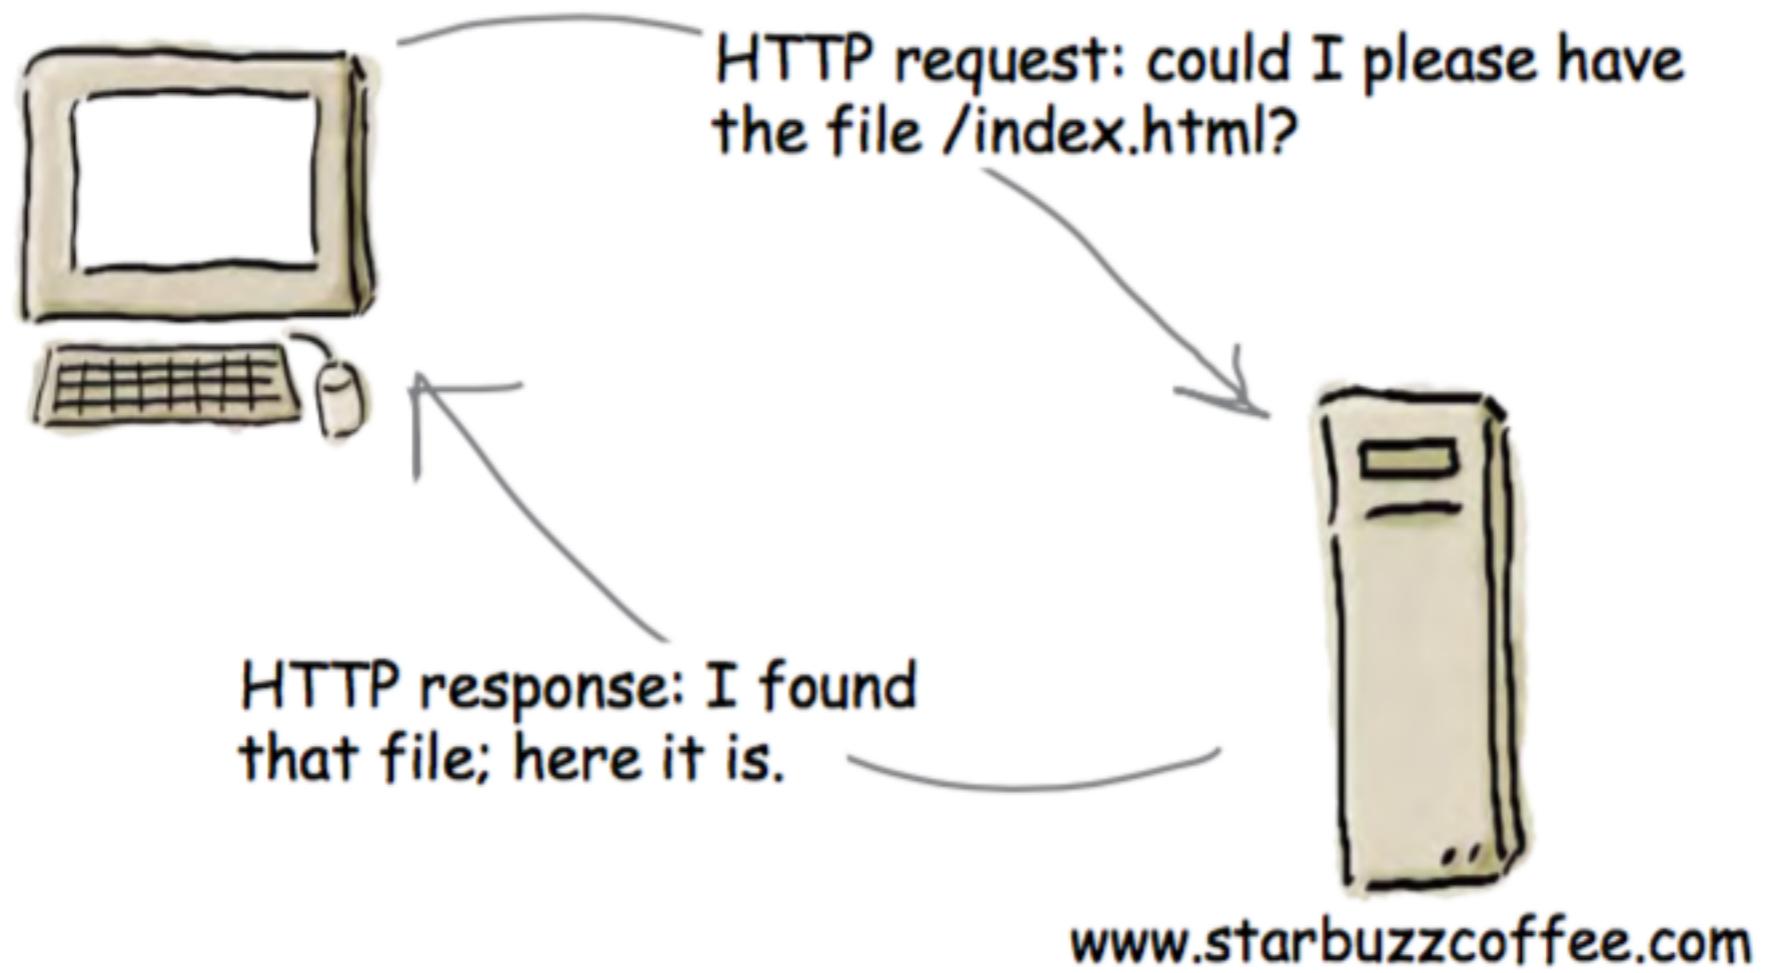

- Many Different Options:
 - FTP
 - Dropbox
 - WebDav
 - Git Push
 - Email Attachments
 - Etc...

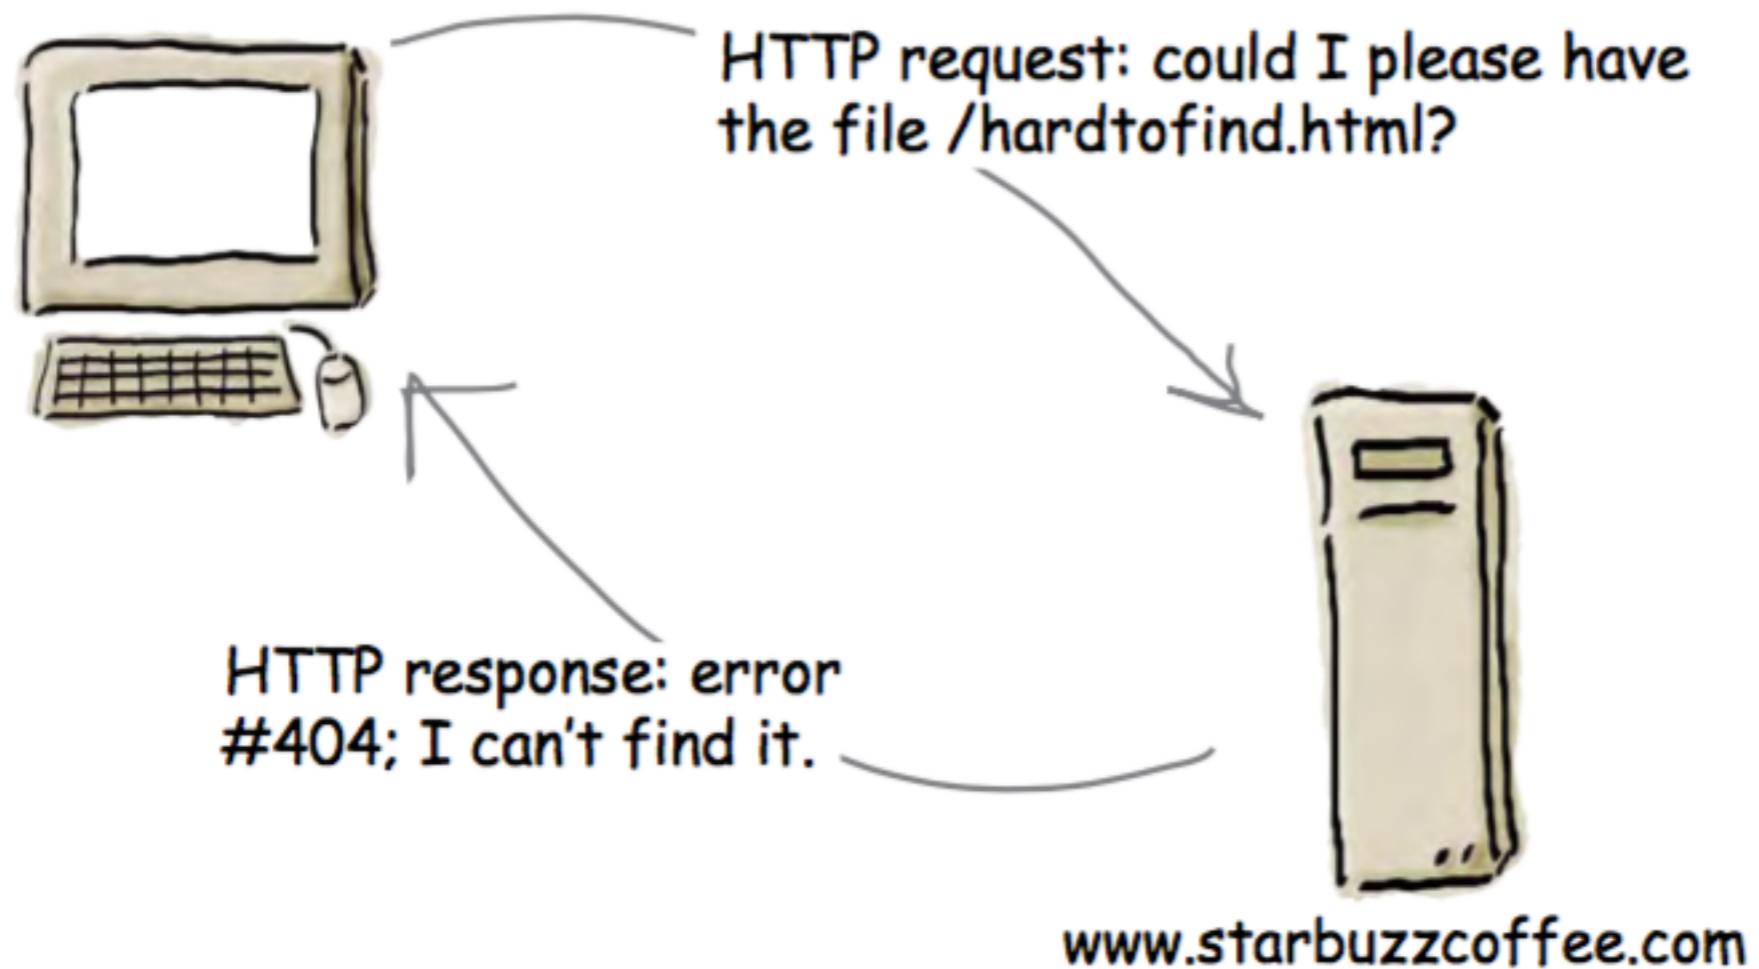

HyperText Transfer Protocol - HTTP

- One Deployed - the site will be ‘served’ over HTTP to client browsers
- An agreed-upon method (a protocol) for transferring hypertext documents around the Web.
- While “hypertext documents” are usually just HTML pages, the protocol can also be used to transfer images, or any other file that a web page might need.

- Each time you type a URL into your browser's address bar, the browser asks the server for the corresponding resource using the HTTP protocol.
- If the server finds the resource, it returns it to the browser and the browser displays it

- If the resource can't be found, you'll get the familiar "404 Error," which the server reports back to your browser.

Absolute & Relative Paths

- A Path is a series of folder or folders that specify a route to a specific file within a given folder tree structure.
 - An Absolute path always starts at the ‘root’, which is always denoted by the / symbol
- A Relative path traces a route from the current director to a specific file. I may comment with:
 - . *start at the current directory*
 - .. *go up one level*
 - folder-name - *start with the ‘folder-name’ in the current directory.*

Relative Paths

First, you need to go up one folder. How do you do that? With a "..". That's right, two periods. Go with it, we'll explain in a sec.

Pronounce ".." as "dot dot".

Separate all parts of the path with a "/".

Finally, you have the filename.

... / **lounge.html**

Putting it all together...

`Back to the Lounge`

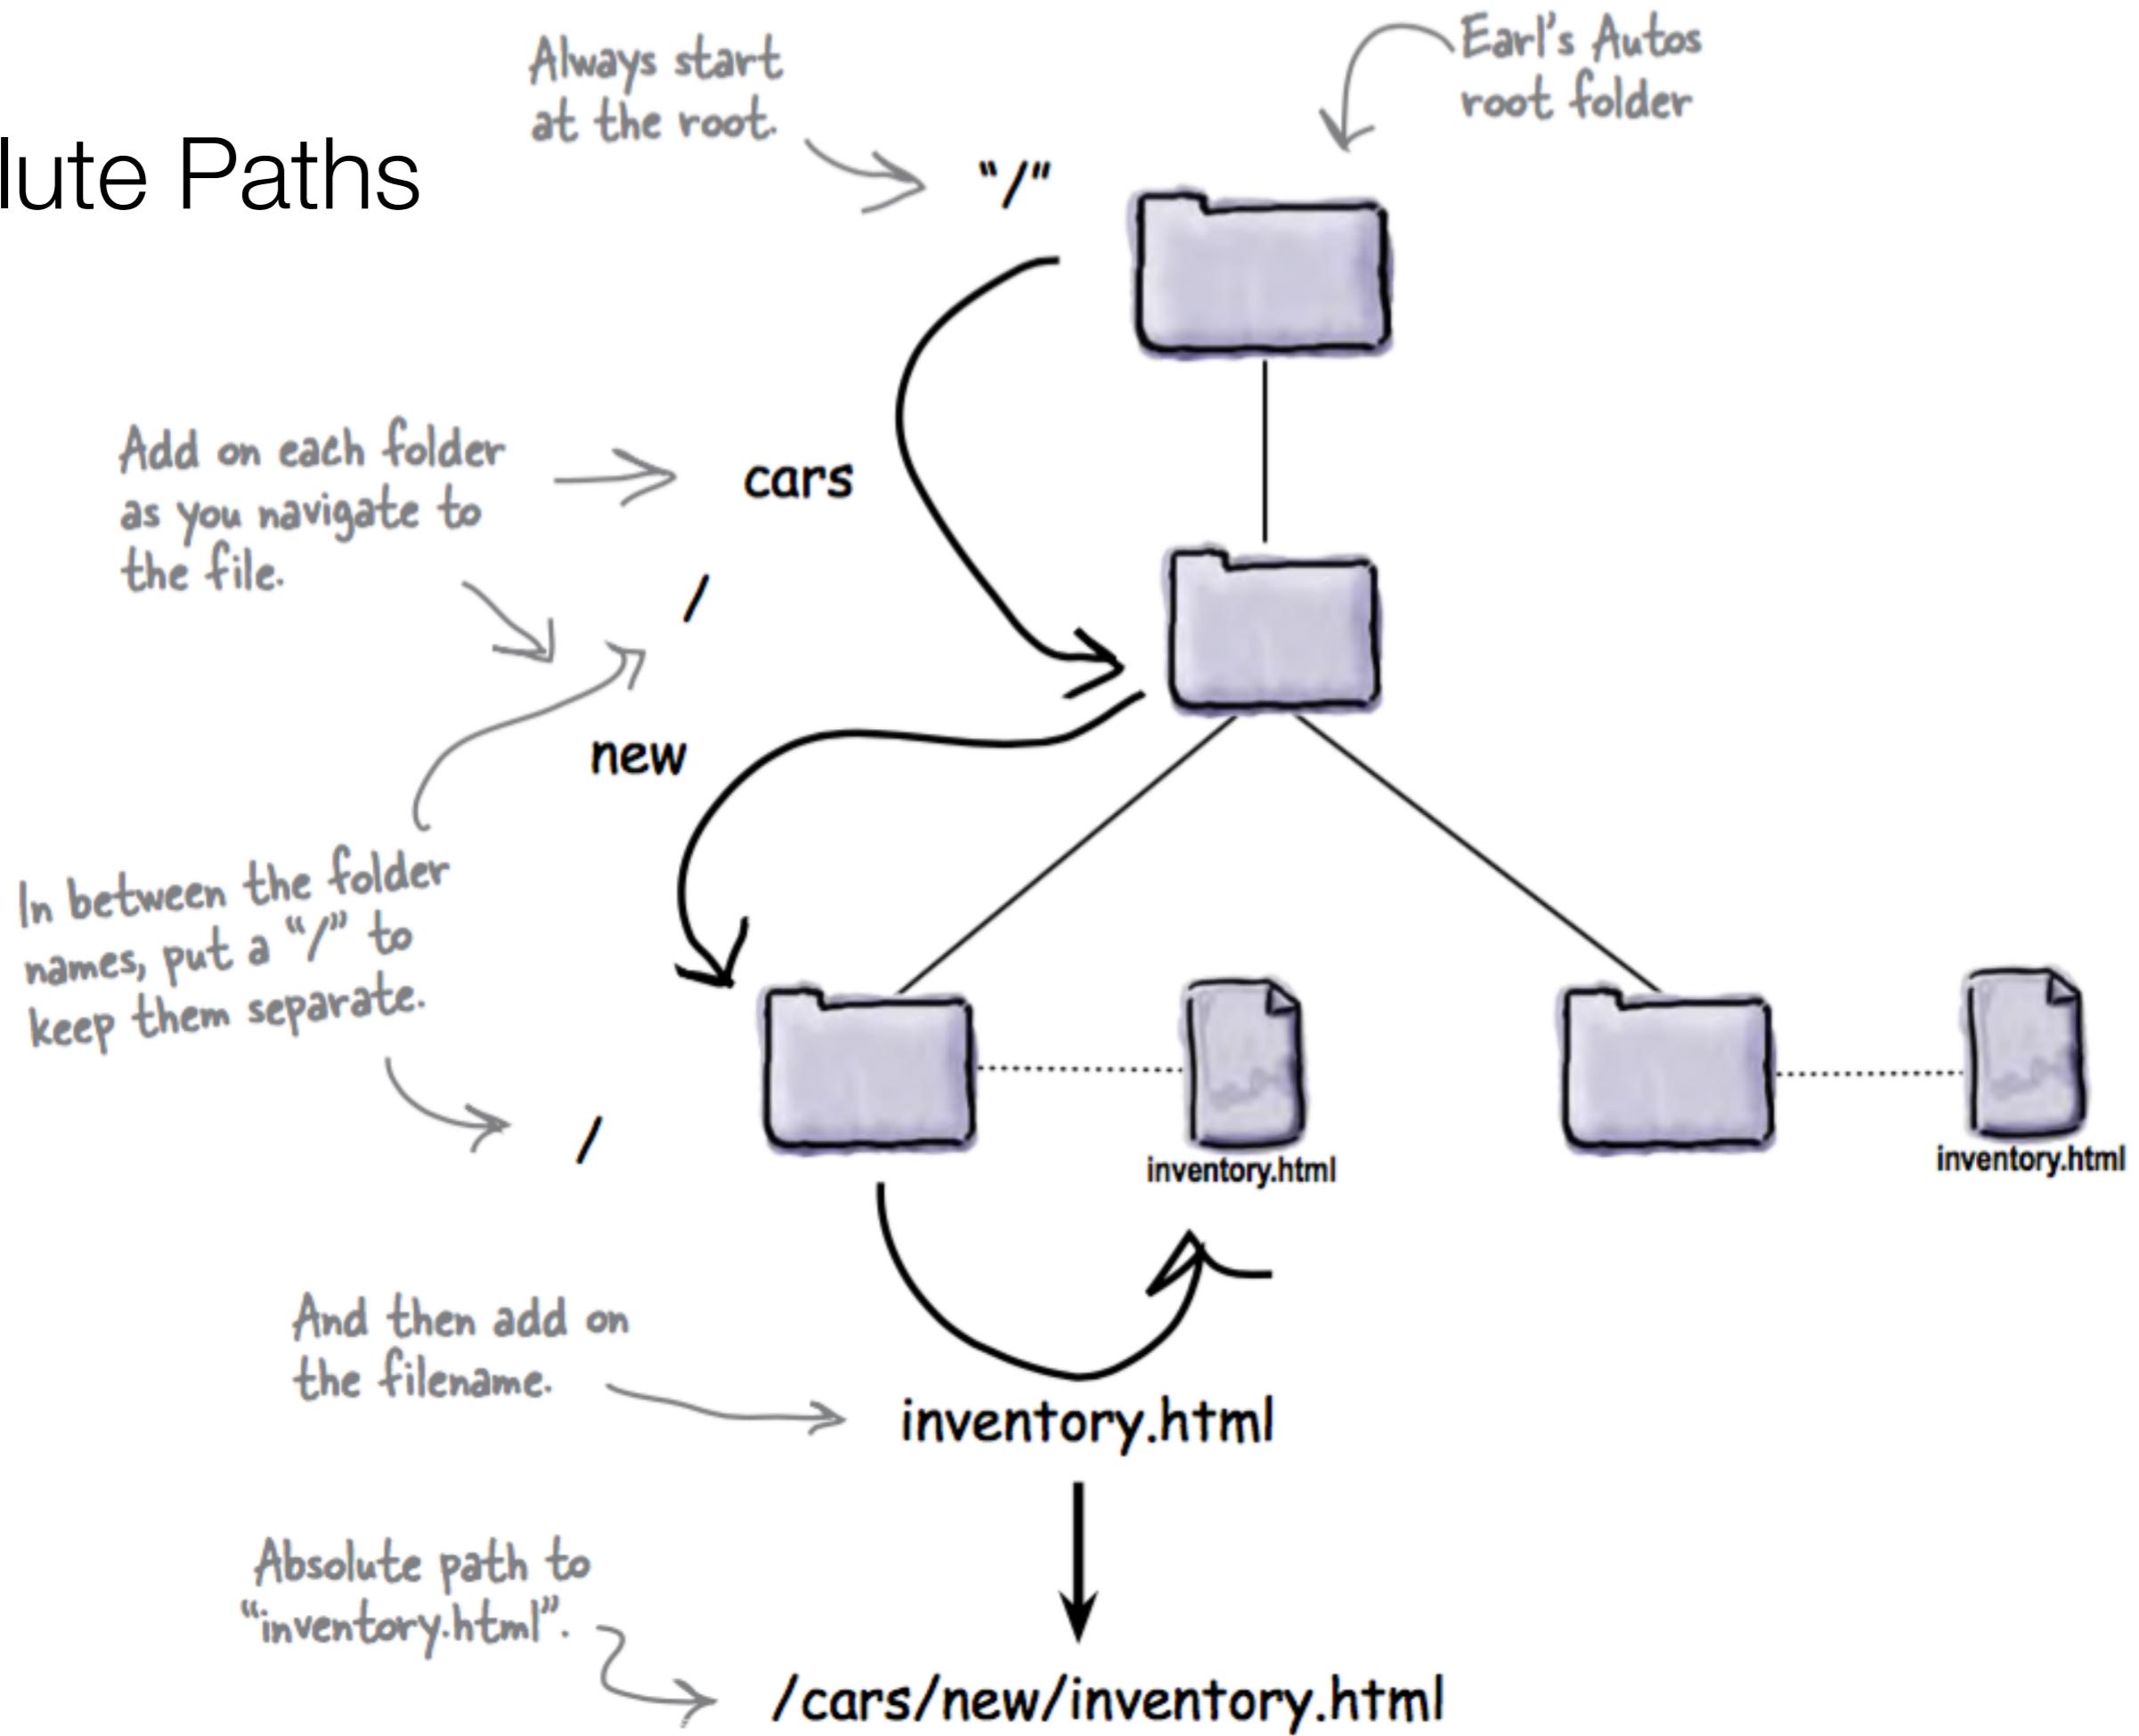

Now when you click on the link, the browser will look for the "lounge.html" file in the folder above.

.../.. Go up 2 levels

.../../images/iot

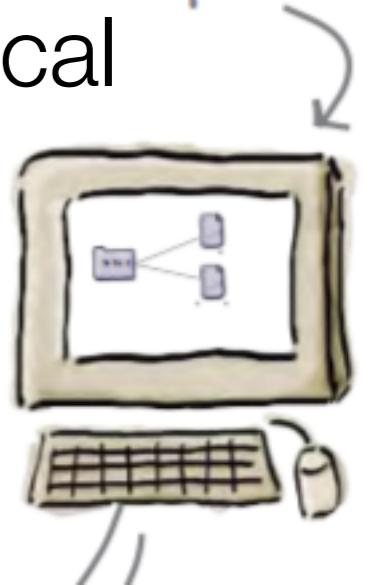

Go up 2 levels and then down into images and into iot

Absolute Paths

Paths on Local Web Sites

The files are sitting
on your computer.

- When a site is loaded directly into a browser on a local machine (as you have been doing so far):
 - You cannot reliably use absolute paths
 - If you do, then the site will be tied to the specific disk structure on your computer.
 - E.g. '/images/main.png' may translate to
 - 'C:\MyDocuments\Web\project\images\main.png'
- This site will not be usable on other computers.

Paths for Deployed Sites

- You **can** reliably use absolute paths
- They will resolve to the Root folder of your project
- This can be more convenient to manage the sites links
- However, the site can only then be browsed via a server - it cannot be loaded from disk directly
